**Abstract.** New data of the arrival directions of EAS at Tien-Shan are presented in various Ne-intervals from  $10^8$  to  $10^9$  ( $E_0 > 0.2$  EeV). The EAS directions are compared with the Galaxy plane and X-ray pulsars locations. The problems of EAS energy spectrum and the anisotropy at very high ener-

gies and chance of concordance different data are discussed.
